

From these thinkers I learned how to ask — not just what to cite.

Intellectual provenance, not citation dump. Each entry names a question I would not have asked without them.

Takens, Sauer, Yorke
embedding theory

Takens 1981 · Sauer-Yorke-Casdagli 1991

From them, I learned to ask...
...whether the data's latent dynamics could be reconstructed from a sufficiently rich observation function — and whether that reconstruction is measurable on real ERPs.

Exp B

Maass, Natschläger, Markram
liquid state machines

Maass, Natschläger, Markram 2002

From them, I learned to ask...
...what kind of dynamical state space a useful reservoir must possess, and what separation property it must exhibit for distinct inputs.

Exp B premise · Ch. 5 architecture

Jaeger, Lukoševičius
Echo State Network theory

Jaeger 2001 · Lukoševičius-Jaeger 2009

From them, I learned to ask...
...whether the reservoir's response to input was consistent enough to be readable — and how to measure that consistency rather than assume it.

Exp A

Oseledec, Benettin, Wolf
Lyapunov spectra & numerical methods

Oseledec 1968 · Benettin et al. 1980 · Wolf et al. 1985

From them, I learned to ask...
...what stability MEANS along a driven trajectory — and how to compute it when the analytic Jacobian is undefined at threshold events.

Exp A method

Bullmore, Sporns
graph-theoretic neuroscience

Bullmore & Sporns 2009

From them, I learned to ask...
...whether the brain's spatial structure could be operationalized as a measurable graph — and whether that graph carries clinical information that survives nullification.

Ch. 5 graph construction · Exp D

Marder, Krakauer et al.
philosophy of neuroscience

Marder 2015 · Krakauer, Ghazanfar, Gomez-Marin, MacIver, Poeppel 2017

From them, I learned to ask...
...whether benchmark accuracy is what we should optimize for in clinical neuroscience — and what we lose when interpretability becomes the trade variable.

Methodological Refusals · J contributions
